Apheresis refers to the process of separating the cellular and soluble components of blood using a machine. Apheresis is often done on donors where whole blood is centrifuged to obtain individual components (eg, red blood cells [RBCs], platelets, plasma based on specific gravity) to use for transfusion in different patients.

Apheresis procedures [Plateletpheresis, Plasmapheresis/ Therapeutic Plasma Exchange (TPE), & Peripheral Blood Stem Cell Collection (PBSC)] are usually well tolerated. Occasionally, Adverse Events (AEs) of variable severity may occur during or after the procedure. AEs that occur in Donors/Patients are divided into local reactions and systemic reactions. Materials and Methods: A total of 3,367 ...

Apheresis Procedure Besides dialysis, apheresis takes an important therapeutical place as an extracorporeal blood purification treatment. Basically, a distinction is made between whole blood processes (such as haemoperfusion) and filtration procedures. In filtration procedures blood plasma is separated via a hollow-fiber capillary as a first step. If this plasma is then dispose of and replaced ...

Apheresis Procedures. Apheresis – also referred to as dialysis – is a method that specifically removes blood parts or pathogens from the blood or blood plasma. This is done outside of the body in complex apheresis machines. Afterwards, the cleaned blood or blood plasma returns to the body. The method is generally tolerated very well.

[Apheresis - webpath.med.utah.edu](#)

Therapeutic apheresis is a therapy for removing pathogenic substances from blood using filters and adsorbers. This can lead to a medical improvement when other treatment options have reached their limit. In contrast to conventional therapies, therapeutic apheresis focuses on "washing" harmful components out, instead of supplying substances. The healthy blood or plasma is returned back ...

Cell apheresis, in general, is a widely accepted, safe, and effective procedure used to collect a large volume of one or more components from the blood. The leukapheresis procedure is a short term process that lasts between 80-150 minutes from a non-mobilized donor (a donor in a physically stable position) and is very safe when performed in specialized facilities. Leukapheresis can be ...
