[Human genetics: Problems and approaches](#)

About 3700 human genes have already been mapped to chromosomal sites. Many such genes have been cloned, and the various mutations causing disease have been identified. Novel mutational mechanisms such as expanded trinucleotide repeats have been discovered in conditions such as Huntington's disease and the fragile X syndrome of mental retardation. Gene action now can often be elucidated by studying the pathway from gene to phenotype following positional cloning rather than working in ...
